

Government Grievance Assessment Report

Case Identification

Grievance ID: G-20230211-001

Date of submission: On or around February 11, 2023

Nature of grievance: Complaint

Category: Sanitation

Subcategory: Sewage Drainage Problems

Priority: High

Detailed Assessment and Case Study

The grievance of sewage drainage problems in Mumbai has been identified as a critical issue affecting the health and well-being of residents, particularly in informal settlements or slum areas. The image analysis reveals a severely polluted urban environment with a highly choked water channel or canal, indicating a significant lack of proper waste disposal and drainage infrastructure. The sheer volume of trash suggests severe blockage and pollution, posing a high risk of waterborne diseases and environmental degradation. This problem has been recurring in urban areas, particularly in areas with poor infrastructure or inadequate maintenance. The affected residents have reported health concerns and discomfort due to the presence of sewage water or odors. The local authorities or civic agencies are often responsible for resolving the issue, but may require prompting or follow-up from residents. The severity of the problem, as depicted in the image, indicates a critical need for immediate attention and resolution. The Public Works Department (PWD) or Municipal Corporation of Mumbai is recommended to take necessary measures to prevent similar incidents in the future. The expected resolution time is within 72 hours, and the risk assessment is high due to the potential for waterborne diseases, environmental pollution, and health crises if not addressed promptly.
